

Model Deployment Report (Heroku)

Name: Model Deployment - Heroku

Report date: 16/04/2022

Batch: LISUM05

Data intake by: Arnold Amusengeri

Data intake reviewer: N/A

Data storage location: <https://github.com/ahnoamu/ML-Deployment-Heroku/>

STEPS FOLLOWED FOR DEPLOYING MACHINE LEARNING MODEL THAT PREDICTS VIDEO GAME SALES, ON CLOUD (HEROKU)

1. **Generate model:** Generated regression model based on video game sales data (vgsales.csv), serialized, and saved as a pickle file reg_model.pkl.
2. **Generate prediction_app.py:** prediction_app.py contains flask APIs which request and receive video game input data through the user interface, calculates the predicted Global salevalue based on the regression model (reg_model.py), and returns the predicted value.
3. **Generate index.html:** This is a HTML file containing the structure of the web page. The file points to a web styling file (static/style.css) and company logo (images/Original.svg). The file creates a web interface used to prompt and obtain user input, then displays the predicted sale to the user when the submit button is clicked.
4. **Create templates directory:** Moved the index.html to this directory. Flask will identify the html file in this directory.
5. **Create static directory:** Contains subdirectories /css, with style.css file for web styling, and /images with company logo file Original.svg for display on the web.
6. **Create requirements.txt:** Contains all liability names (modules/libraries) and associated versions, that will be required to run the web application.
7. **Create Procfile:** Used to initiate processes/commands that are executed by the app on startup in Heroku.
8. **Create a repo on GitHub (ML-Deployment-Heroku), upload the files.**
9. **Create a Heroku user account, create a new app, and link it to your online GitHub repo.**
10. **Deploy the model:** The model can be deployed automatically or manually on the Heroku web page.

Snapshots

N/B:

During model deployment Heroku was hit by a security breach that disabled its seamless linking to github repositories, therefore deployment snapshots were unavailable.
